Agenda

- ① Why do we need 2D Array?
- ② Syntax
- ③ Indices
- ④ Solve 8 problems

Sequential collection
of similar item

Syntax of 2D Array

```
int [][] mat = new int [row] [col];
```

```
int mat [][] = new int [row] [col];
```

Index in 2D Array

$N \times M \rightarrow$ N rows
M columns.

we use `[][]` for accessing the cell in 2D matrix

row index col index

Generic 2D Array $[N, M]$

1) Given an $N \times M$ matrix, print its top row

array =

| | | |
|----|----|----|
| -3 | 2 | 7 |
| 1 | -1 | 11 |
| 0 | 2 | 21 |
| 1 | 1 | 1 |

(0,0) (0,1) (0,2)

Output -3, 2, 7

① what are the indices in focus.

(0,0) (0,1) (0,2)

```
for (int col = 0; col < M; col++) {
    sop (mat [0] [col] + " ");
}
```

~

Q2) Given a matrix of size $N \times M$, print its left most column.

| | | | | |
|---------|----|----|----|-------|
| array = | -3 | 2 | 7 | (0,0) |
| | 1 | -1 | 11 | (1,0) |
| | 0 | 2 | 21 | (2,0) |
| | 1 | 1 | 1 | (3,0) |

Output = -3, 1, 0, 1

Indices in focus.

(0,0), (1,0), (2,0), (3,0)

```
for (int row = 0; row < N; row++) {
    sop (mat [row] [0]);
}
```

~

wave form printing

```

-3  2  7
 1 -1 11
 0  2 21
 1  1  1
    
```

```

-3  2  7
11 -1  1
 0  2 21
 1  1  1
    
```

Row

| | | | |
|---|----|----|----|
| 0 | -3 | 2 | 7 |
| 1 | 1 | -1 | 11 |
| 2 | 0 | 2 | 21 |
| 3 | 1 | 1 | 1 |

even
Row no [0, 2]
It is printed
as It is

Row [1, 3]
reverse is
printed
odd

int N = mat.length;

int M = mat[0].length;

for (int row = 0; row < N; row++) {

if (row % 2 == 0) {

for (int col = 0; col < M; col++) {

cout << mat[row][col] << " ";

}

}

else {

for (int col = m-1; col >= 0; col--) {

sop(mat[row][col]);

}

}

sopln();

}
